## Scoring Indicators - A

COURSE NAME : COMPUTER COMMUNICATION AND NETWORKS

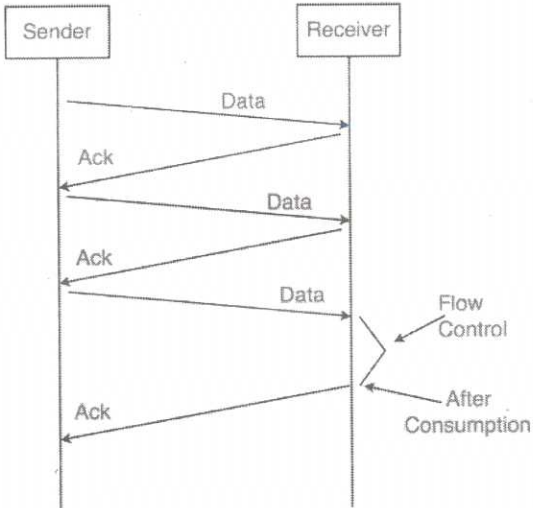

COURSE CODE : 4132

QID :2103230212

Q No	Scoring Indicators	Split score	Sub Total	Total score								
<b>PART A</b>				<b>9</b>								
I. 1	Text, images, audio, video (Any two - 0.5 Marks each).		1									
I. 2	Open Systems Interconnection.		1									
I. 3	Aloha, CSMA, CSMA/CD, CSMA/CA. (Any two)		1									
I. 4	Attenuation is the loss of signal strength.		1									
I. 5	Wifi, Bluetooth, WiMax, Satellite, Infrared etc. (Any two).		1									
I. 6	128 bit.		1									
I. 7	False		1									
I. 8	Protocol, domain name, resource address within domain.		1									
I. 9	Secure Shell		1									
<b>PART B</b>				<b>24</b>								
II. 1	The process of transfer of information from source to destination obeying a set of rules, called the protocol.  Elements: Sender, Receiver, Message, Protocol, Medium.	1.5  1.5	3									
II. 2	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%; text-align: center;">LAN</th> <th style="width: 50%; text-align: center;">MAN</th> </tr> </thead> <tbody> <tr> <td>Local Area Network</td> <td>Metropolitan Area Network</td> </tr> <tr> <td>A group of computers within a small area.</td> <td>Group of computer within a wider area than LAN, usually within a city.</td> </tr> <tr> <td>high speed, low cost.</td> <td>Low speed, high cost.</td> </tr> </tbody> </table>	LAN	MAN		Local Area Network	Metropolitan Area Network	A group of computers within a small area.	Group of computer within a wider area than LAN, usually within a city.	high speed, low cost.	Low speed, high cost.		3
LAN	MAN											
Local Area Network	Metropolitan Area Network											
A group of computers within a small area.	Group of computer within a wider area than LAN, usually within a city.											
high speed, low cost.	Low speed, high cost.											

II. 3	Flow control is the process of managing the rate of data transmission between two nodes to prevent a fast sender from overwhelming a slow receiver.		3	
II. 4	- Minimize electromagnetic radiation. - Resists external interference. - Limit interference with adjacent twisted-pair cables.		3	
II. 5			3	
	<b>Serial</b>	<b>Parallel</b>		
	Single channel	Multiple Channel		
	bit-by-bit transmission	a block of data at once		
	long distance communication	short distance communication		
	low cost and slow speed	high speed, but low cost		
(Any three relevant points)				
II. 6	The IPv4 address is a 32-bit number that uniquely identifies a device in a computer network. An IPv4 address is written in decimal digits, divided into four 8-bit fields that are separated by periods. It consists of two parts, the network part and the host id within the network. Example 192.168.1.5	2 1	3	
II. 7	Communication between two nodes in an interconnected network can take place through many different paths. Routing is the process of selecting the best path using some predetermined rules. Selection of the best timely path improves the performance of the network.		3	
II. 8	IP Range - 192.168.1.16 to 192.168.1.31	1.5	3	
	Mask 255.255.255.240 (or any IP address in the range/28)	1.5		
II.9	Peer-to-peer architecture (P2P architecture), each workstation has the same capabilities and responsibilities. Each station can act as both client and server. P2P networks distribute the workload between peers, and all peers contribute and consume resources within the network without the need for a centralized server.		3	
II.10	DNS is a directory service that provides a mapping between the name of a host on the network and its numerical address. This allows the users of networks to utilize user-friendly names when looking for other hosts instead of remembering the IP addresses.		3	
				42

PART C				
III. 1	a) Diagram - 2 Marks b) Description - 5 Marks <b>1) Physical Layer</b> a) Physical, mechanical, and electrical specifications of the interface and transmission medium. b) Bit Representation and encoding. c) Data rate, Synchronization, Line Configuration, Topology, and transmission modes. <b>2) Datalink Layer</b> a) Node-to-node frame delivery. b) Framing. c) Physical addressing d) Flow Control, Error Control, and Access Controls. <b>3) Network Layer</b> a) Packetization b) Source to Destination Packet delivery. c) Logical (IP) Addressing. d) Routing. <b>4) Transport Layer</b> a) Process to process message delivery. b) Service point (port) addressing. c) Segmentation and Reassembly d) Flow Control, Error Control, and Connection Controls. <b>5) Session Layer</b> a) Dialogue control and synchronization. b) Establishes, control, and maintains user sessions. <b>6) Presentation Layer</b> a) Translation b) Encryption c) Compression <b>7) Application Layer</b> a) User Interfaces to access network services. b) Protocols: NVT, Mail, file transfer, etc.	2	7	7
		5		

III. 2	<table border="1"> <thead> <tr> <th data-bbox="256 300 456 367">Layer</th> <th data-bbox="456 300 1126 367">Protocols</th> </tr> </thead> <tbody> <tr> <td data-bbox="256 367 456 434">Application</td> <td data-bbox="456 367 1126 434">HTTP, NFS, DNS, telnet, SMTP, FTP</td> </tr> <tr> <td data-bbox="256 434 456 501">Transport</td> <td data-bbox="456 434 1126 501">TCP, UDP</td> </tr> <tr> <td data-bbox="256 501 456 568">Internet</td> <td data-bbox="456 501 1126 568">IP, ICMP, ARP</td> </tr> <tr> <td data-bbox="256 568 456 636">Link</td> <td data-bbox="456 568 1126 636">Ethernet, Token Ring, FDDI</td> </tr> </tbody> </table>	Layer	Protocols	Application	HTTP, NFS, DNS, telnet, SMTP, FTP	Transport	TCP, UDP	Internet	IP, ICMP, ARP	Link	Ethernet, Token Ring, FDDI		7	7
Layer	Protocols													
Application	HTTP, NFS, DNS, telnet, SMTP, FTP													
Transport	TCP, UDP													
Internet	IP, ICMP, ARP													
Link	Ethernet, Token Ring, FDDI													
(with description of protocols in each layer)														
III. 3	<p data-bbox="256 685 539 714"><b>Stop and wait Protocol</b></p>  <p data-bbox="256 1294 1166 1323">Used in Connection-oriented communication and offers error and flow control.</p> <p data-bbox="256 1339 357 1368"><b>Sender:</b></p> <ul data-bbox="256 1375 1166 1442" style="list-style-type: none"> <li>- Send one data packet at a time.</li> <li>- Send the next packet only after receiving acknowledgement for the previous.</li> </ul> <p data-bbox="256 1451 389 1480"><b>Receiver:</b></p> <ul data-bbox="256 1487 1134 1554" style="list-style-type: none"> <li>- Send acknowledgment after receiving and consuming a data packet.</li> <li>- After consuming the packet, acknowledgment must be sent (Flow Control)</li> </ul>		7	7										
III. 4	<p data-bbox="256 1563 1241 1630">Data-link layer takes the packets from the Network Layer and encapsulates them into frames. Also, it packs bits received from the physical layer into frames.</p> <p data-bbox="256 1644 480 1673"><b>Parts of a Frame:</b></p> <p data-bbox="256 1680 655 1709">A frame has the following parts –</p> <ol data-bbox="256 1715 1225 1861" style="list-style-type: none"> <li>Frame Header – It contains the source and the destination addresses of the frame.</li> <li>Payload field – It contains the message to be delivered.</li> <li>Trailer – It contains the error detection and error correction bits.</li> <li>Flag – It marks the beginning and end of the frame.</li> </ol> <p data-bbox="256 1899 1171 1928"><b>Types of Framing:</b> Two types, fixed sized framing and variable sized framing.</p>	2	7	7										

	<p>a) Fixed-sized Framing: Here the size of the frame is fixed and so the frame length acts as delimiter of the frame. It does not require additional bits to identify the start and end of the frame.</p> <p>b) Variable – Sized Framing: Here, the size of each frame to be transmitted may be different. So additional mechanisms are kept to mark the end of one frame and the beginning of the next frame. Two approaches in variable sized frames,</p> <p>b1) Byte – Stuffing – A byte is stuffed in the message to differentiate from the delimiter. This is also called character-oriented framing.</p> <p>b2) Bit – Stuffing – A pattern of bits of arbitrary length is stuffed in the message to differentiate from the delimiter. This is also called bit – oriented framing.</p>	3																
III. 5	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%;">CSMA/CD</th> <th style="width: 50%;">CSMA/CA</th> </tr> </thead> <tbody> <tr> <td>Collision detection protocol</td> <td>collision avoidance protocol</td> </tr> <tr> <td>Used in wired networks</td> <td>used in wireless networks</td> </tr> <tr> <td>IEEE 802.3 standard</td> <td>IEEE 802.11 standard</td> </tr> <tr> <td>More efficient than CSMA.</td> <td>Similar to CSMA</td> </tr> <tr> <td>Effective after collision</td> <td>Effective before collision</td> </tr> <tr> <td>Initially transmits the intent to send the data. Once an acknowledgment is received, the sender sends the data.</td> <td>Resends the data frame in case a conflict occurs during transmission.</td> </tr> </tbody> </table>	CSMA/CD	CSMA/CA	Collision detection protocol	collision avoidance protocol	Used in wired networks	used in wireless networks	IEEE 802.3 standard	IEEE 802.11 standard	More efficient than CSMA.	Similar to CSMA	Effective after collision	Effective before collision	Initially transmits the intent to send the data. Once an acknowledgment is received, the sender sends the data.	Resends the data frame in case a conflict occurs during transmission.		7	7
CSMA/CD	CSMA/CA																	
Collision detection protocol	collision avoidance protocol																	
Used in wired networks	used in wireless networks																	
IEEE 802.3 standard	IEEE 802.11 standard																	
More efficient than CSMA.	Similar to CSMA																	
Effective after collision	Effective before collision																	
Initially transmits the intent to send the data. Once an acknowledgment is received, the sender sends the data.	Resends the data frame in case a conflict occurs during transmission.																	
III. 6	<p>In guided transmission, the signal travels through the boundaries of the physical medium. Optical fiber cables employ the principle of total internal reflection of light rays to transmit the signal.</p> <p><b>Advantages</b></p> <ol style="list-style-type: none"> <li>1. Higher bandwidth.</li> <li>2. Less signal attenuation.</li> <li>3. Immunity to electromagnetic interference.</li> <li>4. Resistance to corrosive materials.</li> <li>5. Lightweight.</li> <li>6. Greater immunity to tapping.</li> </ol> <p><b>Disadvantages</b></p> <ol style="list-style-type: none"> <li>1. Installation and maintenance.</li> <li>2. Unidirectional light propagation.</li> <li>3. Cost.</li> </ol>	2 3 2	7	7														

III. 7	<b>TCP vs UDP</b>																														
	<b>Basis</b>	<b>TCP</b>	<b>UDP</b>																												
Definition	Establishes a virtual circuit before transmitting the data.	transmits the data directly to the destination without verifying whether the receiver is ready to receive.																													
Connection Type	Connection Oriented	Connection Less			7	7																									
Speed	Slow	High																													
Reliability	Reliable	Un-reliable																													
Header size	20 bytes	8 bytes																													
Ack	Yes	No																													
Retransmission	Yes	No																													
III. 8	<div style="text-align: center;"> <table border="1" style="margin: auto;"> <tr> <td style="width: 20%;"></td> <td style="width: 20%; text-align: center;">4-11</td> <td style="width: 20%;"></td> <td style="width: 20%; text-align: center;">12-31</td> <td style="width: 20%;"></td> </tr> <tr> <td style="text-align: center;">0-3</td> <td style="text-align: center;">Version</td> <td style="text-align: center;">Traffic Class</td> <td colspan="2" style="text-align: center;">Flow Label</td> </tr> <tr> <td style="text-align: center;">32-47</td> <td colspan="2" style="text-align: center;">Payload Length</td> <td style="text-align: center;">48-55 Next Header</td> <td style="text-align: center;">Hop Limit</td> </tr> <tr> <td style="text-align: center;">64-191</td> <td colspan="4" style="text-align: center;">Source Address</td> </tr> <tr> <td style="text-align: center;">192-288</td> <td colspan="4" style="text-align: center;">Destination Address</td> </tr> </table> </div> <p style="text-align: right; margin-right: 20px;">56-63</p>				4-11		12-31		0-3	Version	Traffic Class	Flow Label		32-47	Payload Length		48-55 Next Header	Hop Limit	64-191	Source Address				192-288	Destination Address				3	7	7
	4-11		12-31																												
0-3	Version	Traffic Class	Flow Label																												
32-47	Payload Length		48-55 Next Header	Hop Limit																											
64-191	Source Address																														
192-288	Destination Address																														
Picture - 3 Marks Definition of components - 4 Marks																															
III. 9	<p>The distance vector routing algorithm works by having each router maintain a routing table, giving the best-known distance from source to destination and which route is used to get there. These tables are updated by exchanging the information with the neighbor having a direct link.</p> <p><b>Algorithm</b></p> <ol style="list-style-type: none"> <li>1. A router transmits its distance vector to each of its neighbors in a routing packet.</li> <li>2. Each router receives and saves the most recently received distance vector from</li> </ol>			2	7	7																									
5																															

	<p>each of its neighbors.</p> <p>3. A router recalculates its distance vector when:</p> <p><input type="checkbox"/> It receives a distance vector from a neighbor containing different information than before.</p> <p><input type="checkbox"/> It discovers that a link to a neighbor has gone down.</p> <p>The DV calculation is based on minimizing the cost to each destination</p>																					
III. 10	<p>Comparison of IPv4 and IPv6</p> <table border="1"> <thead> <tr> <th>Property</th> <th>IPv4</th> <th>IPv6</th> </tr> </thead> <tbody> <tr> <td>Addressing</td> <td>           i) 32 bit            ii) Dotted decimal notation            iii) 4 Octets (4 * 8 =32)            iv) Generates 4 billion unique addresses.         </td> <td>           i) 128 bit            ii) Hexadecimal values with colons            iii) 8 Fields, each with 2 octets, total 16 octets.            iv) Generates 340 undecillion numbers.         </td> </tr> <tr> <td>Classes</td> <td>Five different classes- Class A, B, C, D and E.</td> <td>Classes not supported</td> </tr> <tr> <td>Address Configuration</td> <td>Supports Manual and DHCP.</td> <td>Supports Manual, DHCP, auto-configuration and renumbering.</td> </tr> <tr> <td>Checksum field</td> <td>Available in IPv4</td> <td>Not Available in IPv6.</td> </tr> <tr> <td>Security</td> <td>Security depends on application. Encryption and authentication not supported,</td> <td>IPSEC security feature. Supports encryption and authentication</td> </tr> </tbody> </table> <p>(Any seven points, one mark each)</p>	Property	IPv4	IPv6	Addressing	i) 32 bit ii) Dotted decimal notation iii) 4 Octets (4 * 8 =32) iv) Generates 4 billion unique addresses.	i) 128 bit ii) Hexadecimal values with colons iii) 8 Fields, each with 2 octets, total 16 octets. iv) Generates 340 undecillion numbers.	Classes	Five different classes- Class A, B, C, D and E.	Classes not supported	Address Configuration	Supports Manual and DHCP.	Supports Manual, DHCP, auto-configuration and renumbering.	Checksum field	Available in IPv4	Not Available in IPv6.	Security	Security depends on application. Encryption and authentication not supported,	IPSEC security feature. Supports encryption and authentication		7	7
Property	IPv4	IPv6																				
Addressing	i) 32 bit ii) Dotted decimal notation iii) 4 Octets (4 * 8 =32) iv) Generates 4 billion unique addresses.	i) 128 bit ii) Hexadecimal values with colons iii) 8 Fields, each with 2 octets, total 16 octets. iv) Generates 340 undecillion numbers.																				
Classes	Five different classes- Class A, B, C, D and E.	Classes not supported																				
Address Configuration	Supports Manual and DHCP.	Supports Manual, DHCP, auto-configuration and renumbering.																				
Checksum field	Available in IPv4	Not Available in IPv6.																				
Security	Security depends on application. Encryption and authentication not supported,	IPSEC security feature. Supports encryption and authentication																				
III. 11	<p><b>File Transfer Protocol:</b> Standard protocol for transmitting the files from one host to another reliably and efficiently. In FTP architecture, there are three types of processes in the client and two types in the server.</p> <p><b>Two types of connections:</b></p> <p>i)<b>Control connection:</b> Port 21. Simple rules for connection. Connection between the control process to exchange control signals and responses. Remains connected till the end of the active session.</p> <p>ii)<b>Data Connection:</b> Port 20. Complex rules. The data connection is made between data transfer processes. The data connection opens when a command comes for transferring the files and closes when the file is transferred.</p> <p><b>Merits</b></p> <p><input type="checkbox"/> Speed: The fastest way for file transfer.</p>	1.5	1.5	7	7
